

# Using the shell

---

Johan Öhlin

26 October 2021

Yabs

Johan Öhlin

At Yabs since 2017

Primarily running GNU+Linux since 2008

# The terminal

Started as a keyboard driven user interface to the operating system's kernel

Grown to not primarily not communicate directly with the kernel

More 'advanced' scripts to automate chores

## “Shell” vs. “terminal”

Pretty much used interchangeably

Terminal (emulator) controls few things and executes shell

Shell interprets ‘commands’ and their interfaces

Bourne-Again Shell (GNU, 1989)

Replacement of Bourne Shell (Bell, 1979)

De-facto standard on GNU+Linux systems

Available on Mac and Windows

# Alternatives

|                   |                            |           |
|-------------------|----------------------------|-----------|
| <code>cs</code>   | C shell                    | 1978–     |
| <code>fish</code> | Friendly interactive shell | 2005–     |
| <code>ksh</code>  | Korn shell                 | 1983–2012 |
| <code>zsh</code>  | Z shell                    | 1990–     |

All directories has itself in it, called `.`

All directories has previous directory in it, called `..`

Your home directory is called `~`

Everything starts at the root directory, called `/`

“Everything is a file”. Eg. `/dev/cdrom0`, `/dev/hda0`, etc.

# Basics

\$ command [options and arguments]

|       |                               |                             |
|-------|-------------------------------|-----------------------------|
| cd    | Change directory              | \$ cd .././dir              |
| rm    | Remove                        | \$ rm secrets.gz            |
| mkdir | Create directory              | \$ mkdir newdir             |
| rmdir | Remove <u>empty</u> directory | \$ rmdir olddir             |
| touch | Change file timestamps        | \$ touch newfile            |
| mv    | Move a file (also rename)     | \$ mv olddir/file<br>newdir |
| ls    | List files in directory       | \$ ls ~                     |

Note that `cd` is a built-in command and not an external program.

## Basics - Example

```
$ mkdir "bash course"
$ mkdir "bash course/day 1"
$ cd "bash course/day 1"
$ cd ..
$ rmdir "day 1"
$ touch "file 1" "file 2"
$ mv "file 2" "file 1"
$ rm "file 1"
$ mv "file 1" "../file"
$ rm "../file"
```

# How to

A lot of programs make use of `--help` option. You can usually figure out how a program works by using it. (It can often be shortened to `-h.`)

|                     |   |                           |
|---------------------|---|---------------------------|
| <code>man</code>    | Briefer <b>man</b> ual page   | <code>\$ man ls</code>    |
| <code>info</code>   | More extensive <b>information</b>                                       | <code>\$ info ls</code>   |
| <code>whatis</code> | Header of man page.   | <code>\$ whatis ls</code> |
| <code>tldr</code>   | Web client for a project called tldr-pages; <code>tldr.ostera.io</code> | <code>\$ tldr ls</code>   |

Online search engines.

## File content

|      |  |                                 |
|------|--|---------------------------------|
| cat  | Concatenates and prints files on the standard output | <code>\$ cat file1 file2</code> |
| head | Outputs the first part of files                      | <code>\$ head -n 20 file</code> |
| tail | Outputs the last part of files                       | <code>\$ tail -n 20 file</code> |
| less | Outputs the first part of files                      | <code>\$ head -n 20 file</code> |

## File content - Example

```
$ cat "file"  
$ head -n 2 /dev/urandom  
$ tail -n 2 "some file"  
$ less /some/file
```

## Finding programs

|         |  |                  |
|---------|--|------------------|
| command | Finding location of program to run (from \$PATH) | \$ command -v ls |
| which   | Finding location of program to run (from \$PATH) | \$ which ls      |

# Piping

Communication between programs.

```
$ ls | wc -l | sort -u
```

Writing to file.

```
$ ls > file
```

```
$ > file ls
```

Reading from file.

```
$ wc < file
```

```
$ < file wc
```

Appending to file.

```
$ echo hello >> file
```

```
$ >> file echo hello
```

# Piping

Combining execution.

```
$ ls; echo "hello"
```

First have to succeed.

```
$ ls && echo "hello"
```

Execute second if first fails.

```
$ ls || echo "hello"
```

Combine them.

```
$ (ls || echo "hello") && pwd
```

## Core utils

A handful of GNU core utils 8,27.

IEEE Std 1003.1-2008 utilities

|       |   |  |
|-------|---|--|
| date  | Prints or sets the system date and time | \$ date<br>--date="fortnight"                |
| dd    | Copies and converts a file              | \$ dd<br>if=/home/ubuntu.iso<br>of=/dev/usb0 |
| df    | Shows disk free space on file systems   | \$ df -h dir/file.txt                        |
| du    | Shows disk usage on file systems        | \$ du -h dir/file.txt                        |
| ln    | Creates a link (shortcut) to a file     | \$ ln -s existing_file<br>link               |
| false | Does nothing, but exits unsuccessfully  | \$ false                                     |

## Core utils

|                     |                                       |                                  |
|---------------------|---------------------------------------|----------------------------------|
| <code>mktemp</code> | Creates a temporary file or directory | <code>\$ mktemp</code>           |
| <code>nl</code>     | Numbers lines of files                | <code>\$ nl file</code>          |
| <code>printf</code> | Formats and prints data               | <code>\$ printf "0x%x" 20</code> |
| <code>pwd</code>    | Prints the current working directory  | <code>\$ pwd</code>              |
| <code>seq</code>    | Prints a sequence of numbers          | <code>\$ seq 1 7 32</code>       |
| <code>shuf</code>   | Generate random permutations          | <code>\$ shuf -u fil</code>      |
| <code>sleep</code>  | Delays for a specified amount of time | <code>\$ sleep 30 1m</code>      |

## Core utils

|                   |   |                              |
|-------------------|---|------------------------------|
| <code>sort</code> | Sort lines of text files                                    | <code>\$ sort -u file</code> |
| <code>stat</code> | Returns data about an inode                                 | <code>\$ stat file</code>    |
| <code>tac</code>  | Concatenates and prints files in reverse order line by line | <code>\$ tac file</code>     |
| <code>tee</code>  | Sends output to multiple files                              | <code>\$ tee file</code>     |
| <code>tr</code>   | Translates or deletes characters                            | <code>\$ tr "\n" "\t"</code> |
| <code>true</code> | Does nothing, but exits successfully                        | <code>\$ true</code>         |

|                  |   |                            |
|------------------|---|----------------------------|
| <code>wc</code>  | Prints the number of bytes, words, and lines in files | <code>\$ wc -l file</code> |
| <code>yes</code> | Prints a string repeatedly                            | <code>\$ yes no</code>     |
